Marathon Day-1

Update -1

Created repository for the HCD product we titled as the "**Biometric-attendence"** In that we have given the access to all.

We have studied data sheet about the esp32 and fingerprint sensor.

And when we are connecting the esp32 to port through integrated development port it was Not detecting. For that problem we found the reason that there is no required driver file for ESP32.

Update-2

For the product we need the good structure, so for we searched and we found the good .stafile and we supposed to convert that into the .gcodefile for the printing.

Update-3

When deep dive into solution, infornt we have the three different ways to store and to mark the data they

1. Creating the dashboard as our own and linking to the cloud.
2. We have the IFTTT in the store, free no-code automation platform that connects apps, services, and smart home devices to automate tasks.
3. Google sheet where we can change as our requirement.

From this types we selected the 3rd option, In that we have the little easy than other ways with my knowledge based selection.

Update-4

In the deployed apps script in the google sheet as our requirement, so we have created the three sheets in that we have the students list, and subjects list and the attendance list .
In the students list we store the data of the students like enrollment, name, and id.
In the subjects list we enroll the subject name and the timings of the particular subject.
In the attendance list we mark the attendance where have the columns like student name, subject name, status of the attendance, enrollment number and id.

Update-5

After deployment the apps script into google sheet we go the errors like the cloud is not connecting to the given URL which provide by the google sheet ,before this we got error regarding the authentication access in this more time is wasted.

Update -6

We debugged the error after long time involvement in errors. And after that we tested the google sheet whether it is opening or not by giving the editor access.
